Patent No. 6432669

GENERAL INFORMATION

APPLICANT: LOCAMORE, Sheena M.

APPLICANT: Reln, Michel H.

TITLE OF INVENTION: Protective Recombinant Haemophilus Influenzae High

TITLE OF INVENTION: Protective Weight Proteins

FILE REFERENCE: 1038-861 MIS: jb

CURRENT APPLICATION NUMBER: US/09/206,942

CURRENT PILING DATE: 1998-12-08

EARLIER FILING DATE: 1998-10-07

NUMBER OF SEQ ID NOS: 95

SOFTWARE: PatentIN Ver. 2.1

SEQ ID NO 45

```
The present sequence represents a lectin derived progenitor cell
creservation factor. The protein is used to preserve unipotent,
crells, and also progenitors from nerve, muscle, skin, gut, bone,
cells, and also progenitors from nerve, muscle, skin, gut, bone,
cells, and also progenitors from nerve, muscle, skin, gut, bone,
cells, and also progenitor cerve, muscle, skin, gut, bone,
cells, and also progenitor cells (legistic applications are
confirmed cells intended for administration after antichment cor chancherapy) to reconstitute the haematopoietic system: enrichment cor preserved reals (legistic actions and alignment cells);
creatment of tissues containing haematopoietic progenitors for subsequent transplant to improve haematopoietic competence; improving transfer of transplant to improve haematopoietic competence; improving transfer of haematological disorders, e.g. sickle-cell anaemia); and protection against ablative therapy (to eliminate proliferating cells specifically), collowed by re-establishment of differentiation and proliferation of preserved progenitors. The protein, when linked to magnetic beads, may also be used to to isolate cells that express the FLK2/FLT3 receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SENQTITKAASSNVVAVEFDTYLNPDYGDPNYIHIGIDVNSIRSKVTAKWDWQNGKIATA 180

The present sequence represents a FRIL (FIR2/FIL3 tyrosine kinase composition of one or more members of FRIL family of progenitor cell composition of one or more members of FRIL family of progenitor cell composition of one or more members of FRIL family of progenitor cell cepterating activity of a therapeutic treatment, including radiotherapeutic and/or chemotherapeutic treatments. Administration of FRIL compositions to a chemotherapeutic treatment of the patient with a therapeutic treatment creatment of the patient with a therapeutic treatment of the patient with a therapeutic treatment composition of the patient with a capposition is cell-depleting activity alleviates or reduces the hematopoietic progenitor cell-depleting activity of the patient contrapeutic treatment in the patient. FRIL family members are useful for isolating population of progenitor cells, hemangioblasts, and mesenchymmal cells. The composition is administered to reduce progenitor cell depleting effects of chemotherapeutics, so that the patient can receive a higher dose of the chemotherapeutics, so that the patient can receive a condition where the patients having, or predisposed to developing a condition where the patients having, or predisposed to developing a condition where the patients having, or predisposed to developing the isolated mesenchymal cells are useful for tissue repair.
                                                                                                                                                                                                             Legume Progenitor cell preservation factors for in vivo or ex vivo preservation of hematopoietic progenitor cells and as therapeutics for alleviating/reducing progenitor cell-depleting activity of cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SENQTITKAASSNVVAVEFDTYLNPDYGDPNYIHIGIDVNSIRSKVTAKWDWQNGKIATA 180

Legume Progenitor cell preservation factors for in vivo or ex vivo preservation of hematopoietic progenitor cells and as therapeutics for alleviating/reducing progenitor cell-depleting activity of cancer therapeutics

Example 1; Page 59; 173pp; English.

The present sequence represents fusion protein of alpha-amylase inhibitor signal peptide and FRIL (FIK2/FIL3 tyrosine kinase receptor-interacting clectin). The specification describes a composition of one or more members of FRIL family of progenitor cell preservation factors. The composition of signal state of FRIL family of a therapeutic treatment, including redictivity of a therapeutic treatment, including radiotherapeutic and/or chemotherapeutic treatment. Administration of FRIL compositions to a patient prior to treatment of the patient with a therapeutic treatment having a hematopoietic progenitor cell-depleting activity alleviates or reduces the hematopoietic progenitor cell-depleting activity of the therapeutic treatment in the patient. Composition activity of the therapeutic treatment in the patient. Composition activity of the therapeutic progenitor cells, hemangioblasts, and mesenchymal stem cells. The composition is chemotherapeutics, so that the patient can receive a higher dose of the chemotherapeutics and preferably recover from cancer. It is also chemotherapeutic and preferably recover from cancer. It is also condition where the patients hematopoietic progenitor cells are depleted, such as severe combined immunodeficiency or aplastic anemia.

The present sequence is a partial a FRIL (FIK2/FIL3 tyrosine kinase receptor-interacting lectin) protein. The specification describes a composition of one or more members of FRIL family of progenitor cell preservation factors. The composition is useful for alleviating or reducing the hematopoietic progenitor cell-depleting activity of a therapeutic treatment, including radiotherapeutic and/or chemotherapeutic treatments. Administration of FRIL compositions to a patient prior to treatment of the patient with a therapeutic treatment of the patient with a therapeutic treatment of the patient. FRIL family members are useful for reduces the hematopoietic progenitor cell-depleting activity of the isolating population of progenitor cell-depleting activity of the isolating population of progenitor cells, hemangioblasts, and mesenchymal stem cells. The composition is administered to reduce progenitor cell depleting effects of chemotherapeutics, so that the patient can receive a higher dose of the chemotherapeutics, the converting cancer.

Example 22; Page 116-117; 173pp; English.

therapeutics

It is also administered to patients having, or predisposed to developing a condition where the patients hematopoietic progenitor cells are depleted, such as severe combined immunodeficiency or aplastic anemia. The isolated mesenchymal cells are useful for tissue repair. 234 AA; Seguence

The present sequence represents a FRIL (FIK2/FIL3 tyrosine kinase ceptor-interacting lectin) polypeptide. The specification describes a composition of one or more members of FRIL family of progenitor cell preservation factors. The composition is useful for alleviating cell preservation factors. The composition is useful for alleviating or the preservation factors. Administration of FRIL compositions to a therapeutic treatment, including radiotherapeutic and/or treatments. Administration of FRIL compositions to a tenantopoletic progenitor cell-depleting activity alleviates or changes the hematopoletic progenitor cell-depleting activity alleviates or reduces the hematopoletic progenitor cell-depleting activity alleviates or therapeutic treatment in the patient. FRIL family members are useful for therapeutic treatment in the patient. FRIL family members are useful for stem cells. The composition is administered to reduce progenitor cell depleting effects of chemotherapeutics, so that the patient can receive cell high and done of the chemotherapeutic and prefereiably recover from cancer. It is also administered to patients having, or predisposed to developing a condition where the patients hematopoietic progenitor cells are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Legume Progenitor cell preservation factors for in vivo or ex vivo preservation of hematopoietic progenitor cells and as therapeutics for alleviating/reducing progenitor cell-depleting activity of cancer

                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is that of a jack bean concanavalin A (Con A) mutein in which the Asn-152 residue of the native protein is replaced by Ser in order to disrupt a glycosylation signal. The present invention relates to: a transformed Brassica plant that is resistant to certain insect pests; an expression cassette containing but that codes for at least 1 lectin selected from Con A plant cells containing at least 1 copy of the DNA; the present plant cells containing at least 1 copy of the DNA; the present lectin derived from the jack bean Con A gene; a method of imparting resistance to insects selected from blossom betles (pollen beetles) of the genus Meligethes, flea beetles of the genus Phyllotreta, and root flies of the genus belia; and a method for protecting a plant against infestation by insects of these genera.

The sequences given in AAR74763-70 represent various pentraxins and legume lectins. All these proteins show structural homology and may be used in the molecular design of a molecule for the inhibition of serum amyloid P (SAP) binding to amyloid fibrils. The similarities of serum amyloid P (SAP) binding to amyloid fibrils. The similarities of protein (CRP) and female hamster protein suggests that they may have completed to the procrawtures. The jellyroll topology of the pentraxins is reminiscent of the picornavirus coat proteins which also have commanded to female lectins such as concanavaline and pea lectin. Alignment of sequences on the basis of topologically equivalent features of the three dimensional structures shows that helices occupy different opositions in the pentraxins and legume lectins and that the amino acid sequences of the two families have identities of only approx. 11%. The sequences of the two families have identities of only approx. 11% or there is a long insertion before and after strand L, whereas the condition in the legume lectins cond the helix after strand D. There is a long insertion between the end of the helix after strand D. There is a long insertion between the end of the helix after strand D. There is a long insertion between the end of the helix between H and Strand                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              85 ADGLAFFIAPPDSVI--SYHGGFLGLFPNANTLNNSSTSENQTTTKAASSNVVAVEFDTY 142

The invention relates to Robinia pseudoacacia lectins which can be used in medicine. The lectin is used for the control of mucosal cell proliferation, for the reduction and/or treatment of damage caused by cell damaging agents, especially in the treatment of cancer, and/or for the reduction and/or treatment of metabolic disorders. It is especially useful for the treatment of mucositis in mammalian cells and/or tissues (especially mucous membrane). Use of the lectin is effective and does not damage the gut as is the case with cytotoxic drugs and radiation. The present sequence represents a polypeptide subunit of R. pseudoacacia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          119 STSENQTTTKAASSNVVAVEFDTYLNPDYGDPNYIHIGIDVNSIRSKVTAKWDWQNGKIA 178

The invention relates to Robinia pseudoacacia lectins which can be used for medicine. The lectin is used for the control of mucosal cell proliferation, for the reduction and/or treatment of damage caused by cell damaging agents, especially in the treatment of cancer, and/or for the retatment of mucositis in mammalian cells and/or tissues, particularly human cells and/or tissues (especially mucous membrane). Use of the lectin is effective and does not including mucous membrane). Use of the lectin is effective and does not present sequence represents a R. pseudoacacia lectin RPPAI. This lectin is composed of two subunits- polypeptide a and polypeptide b

```
The invention relates to Robinia pseudoacacia lectins which can be used in medicine. The lectin is used for the control of mucosal cell proliferation, for the reduction and/or treatment of damage caused by cell damaging agents, especially in the treatment of cancer, and/or for the reduction and/or treatment of metabolic disorders. It is especially particularly human cells and/or tissues (especially mucous cells and/or tissues (especially mucous membrane). Use of the lectin is effective and does not damage the gut as is the case with cytotoxic drugs and radiation. The present sequence represents a polypeptide subunit of R. pseudoacacia

                                                                                                                                              The invention relates to Robinia pseudoacacia lectins which can be used in medicine. The lectin is used for the control of mucosal cell proliferation, for the reduction and/or treatment of damage caused by cell damaging agents, especially in the treatment of cancer, and/or for the reduction and/or treatment of metabolic disorders. It is especially particularly human cells and/or tissues (especially mucous membrane). Use of the lectin is effective and does not including mucous membrane). Use of the lectin is effective and does not damage the gut as is the case with cytotoxic drugs and radiation. The present sequence represents a R. pseudoacacia lectin RPDAII. This lectin is composed of the subunit- polypeptide c (AAY06813).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is that of pea cv. Lincoln lectin. The invention relates to: a transformed Brassica plant that is resistant to certain insect pests; an expression cassette containing DNA that codes for at least 1 lectin selected from Con A (see AAY58736), modified Con A (see AAY58737) and pea lectin; transgenic plant cells containing at least 1 copy of the DNA; a new lectin derived from the jack bean Con A gene, a method of imparting resistance to insects selected from blossom beetles (pollen bly) lottectes, and root files of the genus Meligethes, flea beetles of the genus Phyllotreta, and root files of the genus Delia; and a method for protecting a plant against infestation by insects of these genera.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      5 SFSFTKEDPNQEDLIFQGHATSTNNVLQVTKLDSAGNPVSSSAGRVLYSAPLRLWE-DSA 63

The protein derivs. are effective larvicides against insect pupae, such as the European corn borer. The protein used to protect sorghum, wheat, oats, rye, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             62 SAVLTSFDTIINF---EISTPYTSRIADGLAFFIAPPDSVISYHGGFLGLFPNANTLNNS 118

```
The invention describes compounds derived from Bauhinia purpurea lectin

((BPL), a 262 amino acid peptide comprising 7 lysine residues - the

present sequence) by the replacement of one or more lysine residues with

cother amino acid residues which either preserve the positive charge or

cother amino acid residue at the point of substitution. The compounds are

cother amino acid residue at the point of substitution. The compounds are

cother as larvicides against insects such as the European corn borer

cother in a larvicides against insects such as the European

corn borer. The BPL-derivatives are effective against insects which

may be resistant to the naturally occurring form of BPL. Crops which

corn borer. The BPL-derivatives are effective against insects which

may be resistant to the naturally occurring form of BPL. Crops which

corp section as a ferivatives are corn/maize (2ea mays), rye,

barley, wheat (Triticum aestivum), sorghum (Sorghum bicolor), oats,

corp s (such as cotton), fruit crops (such as melons) and vegetable crops

Morel mannose-specific and sugar specifically aggregatable lectin from bark of the Japanese pagoda tree (sophora japonica).";

J. Biol. Chem. 266:3146-3153(1991).

-! FUNCTION: MANNOSE/GLUCOSE-BINDING BARK LECTIN. DISPLAYS

-! FUNCTION: MANNOSE/GLUCOSE-BINDING BARK LECTIN. DISPLAYS

STOCKS OF NITROGEN DURING ACTIVITY. THIS ACTIVITY IS LOST AT PH BELOW 6.

-! FUNCTION: BARK LECTINS ARE STORAGE PROPEIN THAT PROBABLY MAINTAINS STOCKS OF NITROGEN DURING DORMANT PERIOD. SELF-AGGREGATABLE MOLECULES THAT CAN BIND THEIR OWN CARBOHYDRATE SIDE CHAINS. THEY COULD ALSO PLAY A ROLE IN THE PLANT'S DEFENCE AGAINST PHYTOPHAGOUS INVERTEBRATES OR HERBIVOROUS HIGHER ANIMALS.

1. 14.449-456(1997).

1. FUNCTION: BARK LECTINS ARE STORAGE PROTEIN THAT PROBABLY MAINTAINS STOCKS OF NITROGEN DURING DORMANT PERIOD. SELF-AGGREGATABLE MOLECULES THAT CAN BIND THEIR OWN CARBOHYDRATE SIDE CHAINS. THEY COULD ALSO PLAY A ROLE IN THE PLANT'S DEFENCE AGAINST PHYTOPHAGOUS INVERTEBRATES OR HERBIVOROUS HIGHER ANIMALS (BY SIMILARITY).

1. SUBUNIT: HOMOTETRAMER OR HETEROTETRAMER OF MAHB AND MALB SUBUNITS.
